# 1 Matrices and Gaussian Elimination

## 1.2 The Geometry of Linear Equations

### Problems 1–12

1. For the equations  $x + y = 4$ ,  $2x - 2y = 4$ , draw the row picture (two intersecting lines) and the column picture (combination of two columns equal to the column vector  $(4, 4)$  on the right side).

### 1.2.1

2. Solve to find a combination of the columns that equals  $b$ :

$$u - v - w = b_1$$

$$v + w = b_2$$

$$w = b_3$$

3. Describe the intersection of the three planes  $u + v + w + z = 6$  and  $u + w + z = 4$  and  $u + w = 2$  (all in four-dimensional space).
- Is it a line or a point or an empty set?
  - What is the intersection if the fourth plane  $u = 1$  is included?
  - Find a fourth equation that leaves us with no solution.

### Problems 13–15
